

Big Creek Research and Extension Team

University of Arkansas System Division of Agriculture

Quarterly Report – July 1 to September 30, 2015

MONITORING THE SUSTAINABLE MANAGEMENT OF NUTRIENTS ON C&H FARM IN BIG CREEK WATERSHED

Mission of the University of Arkansas System Division of Agriculture

The mission of the **Division of Agriculture** is to advance the stewardship of natural resources and the environment, cultivate the improvement of agriculture and agribusiness, develop leadership skills and productive citizenship among youth and adults, enhance economic security and financial responsibility among the citizens of the state, ensure a safe, nutritious food supply, improve the quality of life in communities across Arkansas, and strengthen Arkansas families.

Dr. Mark J. Cochran
Vice President for Agriculture

Executive Summary

This is the third Quarterly Report of 2015 for the Big Creek Research and Extension Team that details the following progress made from July 1 through September 30, 2015.

1. We continue to collect weekly baseflow and periodic storm flow water samples from Big Creek above and below the C&H Farm, along with water from a spring, ephemeral stream, surface runoff sites on Fields 1, 5a, and 12, two interceptor trenches below the slurry holding ponds, and house well for chemical and bacterial analysis.
2. Nitrate-N concentration in Big Creek below the C&H Farm continue to be greater than those measured at the upstream site. Based on numerous stream-water monitoring studies conducted by USGS, U.S. EPA, and Land-Grant entities, we know that there are temporal and spatial factors, such as land use in the drainage watershed, which influence stream water nitrate-N concentrations. We will continue to monitor nitrate-N and other constituents to determine if and when they exceed known standards. For nitrate-N, the drinking water standard is 10.0 mg/L, which has not been exceeded. Standards or thresholds related to recreational or increased algal productivity involve phosphorus and not nitrogen forms.
3. Concentrations of nitrate-N and bacteria collected from the house well, which is approximately 400 ft deep and adjacent to the manure holding ponds have periodic high values. These increases were inconsistent, highly sporadic, and other constituents did not show similar increases. We investigated further and discovered intermittent potential sources of contamination between the sampling port and wellhead, which is not representative of the quality of ground water in the aquifer. We have installed a new sampling port closer to the wellhead at the beginning of October, 2015 to ensure that there is reduced potential for contamination of the water from external sources. We will continue to closely monitor the site.

Big Creek Research Team

Andrew Sharpley, Ph.D., TEAM LEADER – Distinguished Professor - Soil science, water quality, soil phosphorus chemistry, agricultural management

Brian Breaker, M.Sc., Hydrologic Technician, stream flow and constituent collection, analysis, and statistical evaluation of trends.

Kris Brye, Ph.D., Professor - Effects of land application of poultry litter on in-situ nutrient leaching, effects of land use and management practices on soil physical, chemical, and biological properties related to soil quality and sustainability

Rick Cartwright, Ph.D., Professor – Associate Director of Extension for Agriculture and Natural Resources

Mark Cochran, Ph.D., – Vice President, University of Arkansas System Division of Agriculture.

Mike Daniels, Ph.D., Professor – Extension water quality and nutrient management specialist

Ed Gbur, Ph.D., Professor and Director, Agricultural Statistics Laboratory - Experimental design, linear and generalized linear mixed models, regression, agricultural applications of statistics.

Brian Haggard, Ph.D., Professor - Ecological engineering, environmental soil and water sciences, water quality chemistry, water quality monitoring and modeling, algal nutrient limitation, pollutant transport in aquatic systems

Phil Hays, Ph.D. Ground Water Specialist, U.S. Geological Survey and Research Professor with Geosciences Dept., University of Arkansas, application of stable isotopes and other geochemical indicators in delineating movement and behavior of contaminants in ground-water systems

Tim Kresse, M.Sc., Water Quality Specialist, U.S. Geological Survey, natural geochemical evolution of groundwater and separating these processes from anthropogenic sources of contamination

Nathan McKinney, Ph.D., – Assistant Director, Agriculture Experiment Station

Morteza Mozaffari, Ph.D. – Director, Univ. of Arkansas Soil Testing and Research Laboratory, Marianna.

Mary Savin, Ph.D. - Structure and function of microbial communities in natural and managed ecosystems, microorganisms in nutrient cycling, contaminant degradation

Thad Scott, Ph.D., Associate Professor - Water quality, transport of contaminants to and within water bodies

Karl VanDevender, Ph.D. and P.E., Professor - Extension Engineer, Livestock and poultry manure and mortality management, nutrient management planning

Jun Zhu, PhD., Professor - Biological and agricultural engineering, agricultural sustainability, manure treatment technologies

Adam Willis, M.Sc., Newton County Extension Agent - Agriculture

Field Technicians - The Big Creek Research and Extension Team are ably supported by several excellent Program Technicians based in Little Rock and Fayetteville.

List of Tables

Table 1. Minimum detection limits (MDLs) for each chemical and biological constituent measured.	8
Table 2. Water quality analyses at each sample site. Coliform units are Most Probable Number (MPN) per 100 mL of water for the 3 rd Quarter of 2015.	11
Table 3. Water quality analyses at the spring and in Big Creek upstream and downstream of the C&H Farm boundary of permitted land application for the 3 rd Quarter of 2015.....	29
Table 4. Water quality analyses at the ephemeral stream draining the subwatershed containing the production houses and manure holding ponds, the well adjacent to the ponds, and surface runoff from Fields 1, 5a, and 12 for the 3 rd Quarter of 2015.....	39

Table 5. The pH, Chloride concentration, electrical conducting, and total solids concentration of water samples collected at upstream, downstream, spring, house well and trench sites, initiated at the beginning of 2015	47
Table 6. Mean, standard error of mean, median, minimum, maximum, and standard deviation of chemical constituents measured upstream of the C&H Farm pre-January 1, 2014 (before slurry applications started) and post-January 1, 2014 (after slurry applications started) through September 1, 2015.....	55
Table 7. Mean, standard error of mean, median, minimum, maximum, and standard deviation of chemical constituents measured downstream of the C&H Farm pre-January 1, 2014 (before slurry applications started) and post-January, 2014 (after slurry applications started) through September 1, 2015.....	57

List of Figures

Figure 1. Location of water quality sampling sites on Big Creek and the C&H Farm.....	7
Figure 2. Gage height at the Big Creek monitoring site downstream of the C&H Farm during the 3 rd quarter of 2015.....	9
Figure 3. Water temperature at the Big Creek monitoring site downstream of the C&H Farm during the 3 rd quarter of 2015.....	9
Figure 4. Precipitation at the Big Creek monitoring site downstream of the C&H Farm during the 3 rd quarter of 2015.....	10
Figure 5. Nitrate concentration at the Big Creek monitoring site downstream of the C&H Farm during the 3 rd quarter of 2015.....	10
Figure 6. Differences in phosphorus concentrations between upstream and downstream sites on Big Creek.....	59
Figure 7. Differences in nitrogen concentrations between upstream and downstream sites on Big Creek.....	60
Figure 8. Differences in bacteria concentrations between up and downstream sites on Big Creek.....	61
Figure 9. Temporal variation in nitrate-N concentrations upstream and downstream of the C&H Farm, Newton County, over a two-year period of monitoring (Sept. 2013 to Sept. 2015).	63

Water Sampling and Analytical Methods

Sampling Locations

Water quality monitoring sites are shown in Figure 1 and are;

- Site 1. Edge-of-field monitoring on Field 1 permitted to receive slurry.
- Site 2. Edge-of-field monitoring on Field 5a excluded from receiving slurry.
- Site 3. Edge-of-field monitoring on Field 12 permitted to receive slurry.
- Site 4. Ephemeral stream flow draining a subwatershed containing the production facilities.
- Site 5. Spring below Field 1.
- Site 6. Big Creek upstream of the C&H Farm operation.
- Site 7. Big Creek downstream of the C&H Farm operation.
- Site 8. Manure holding pond trench. The site was visited weekly and trench water sampled when flowing.

Sampling Protocols and Analyses

The following protocols were used to collect, prepare, and analyze all water samples:

1. One-liter acid-washed bottles were used to collect the stream samples for nutrient analyses.
2. Water was collected from just beneath the surface, where the stream was actively moving and well-mixed.
3. The bottle was rinsed with stream water before collecting the sample.
4. Sterilized specimen cups were used to collect samples for bacterial evaluation.
5. Time of collection was noted, and samples placed in a cooler on ice to preserve them until processed and were submitted to the Arkansas Water Resources Center Water Quality Lab on the day of collection for analyses.
6. Analyses included Alkalinity (APHA 2320-B), Ammonia (EPA 351.2), Chloride (EPA 300.0), Dissolved Phosphorus (EPA 365.2), E. coli (APHA 9223-B), Electrical Conductivity (EPA 120.1), Nitrate (EPA 300.0), pH (EPA 150.1), Total Coliforms (APHA 9223-B), Total Dissolved Solids (EPA 160.1), Total Nitrogen (APHA 4500-P J), Total Phosphorus (APHA 4500-P J), and Total Suspended Solids (EPA 160.2). APHA is American Public Health Association from the Wadeable Streams Assessment, Water Chemistry Laboratory Manual
http://www.epa.gov/owow/monitoring/wsa/WRS_lab_manual.pdf
7. The minimum detection limits (MDLs) for each chemical and biological constituent measured are listed in Table 1.
8. Chemical and biological analyses of samples collected from the beginning of 2015 to the end of August, 2015 are presented in Tables 2, 3, and 4.

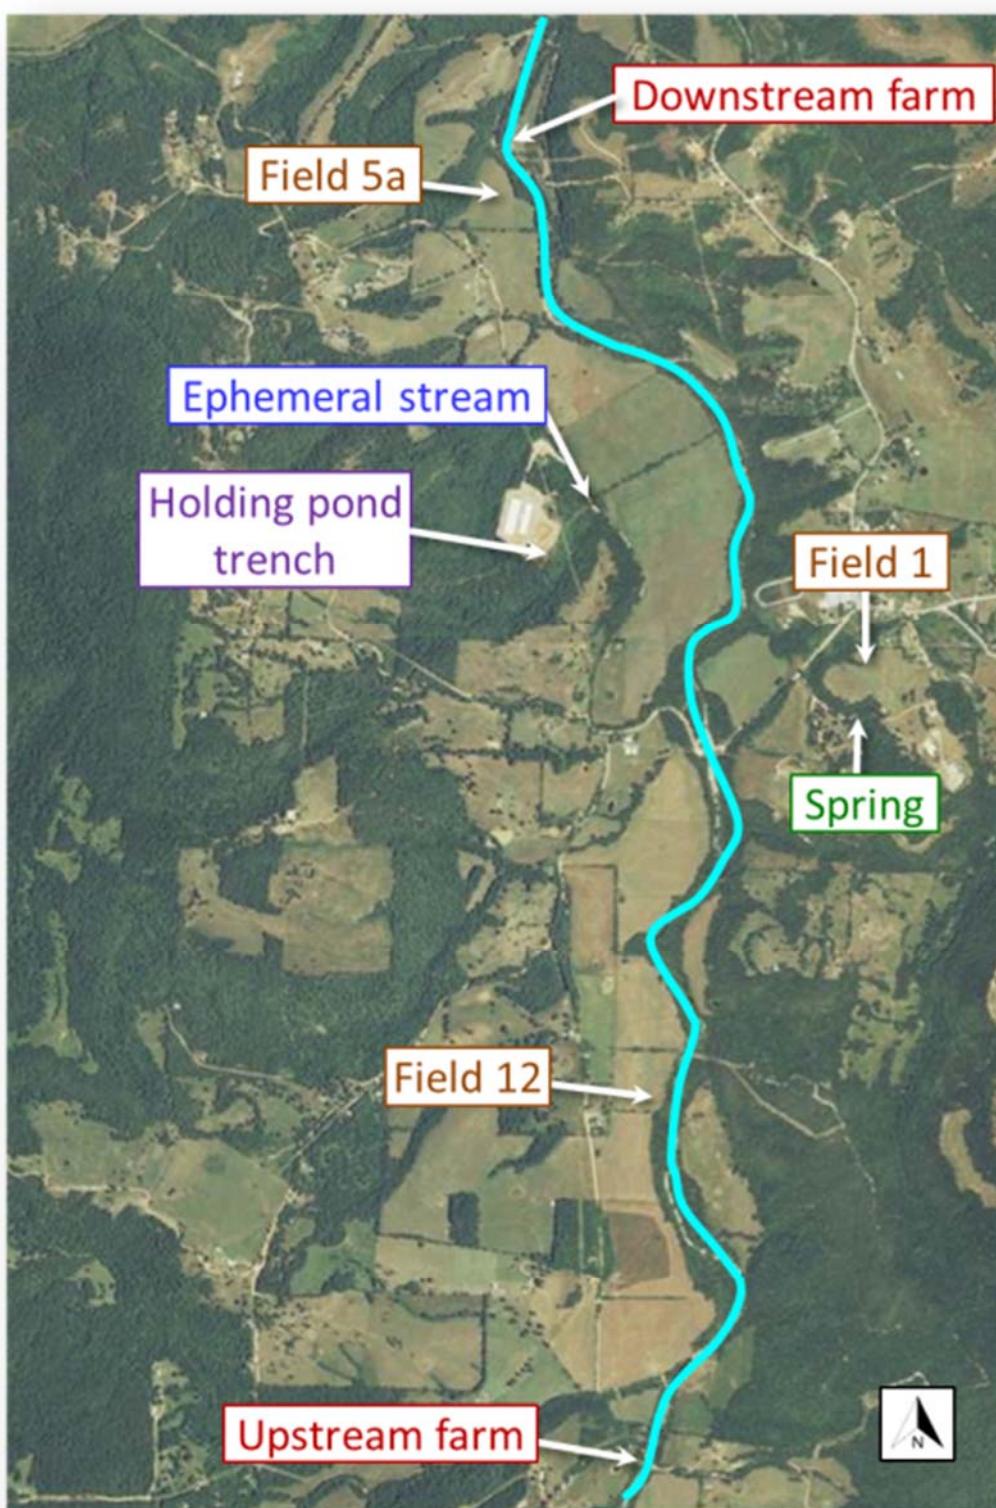

Figure 1. Location of water quality sampling sites on Big Creek and the C&H Farm.

Table 1. Minimum detection limits (MDLs) for each chemical and biological constituent measured.

Constituent	Minimum detection limit ¹
Alkalinity, mg/L as CaCO ₃	2
Chloride, mg/L	0.093
Dissolved P, mg/L	0.002
Conductivity, uS/cm	1
Ammonia-N, mg/L	0.03
Dissolved organic carbon, mg/L	0.18
E. coli, MPN/100 mL	1
Nitrate-N, mg/L	0.004
pH	0.1
Total coliform, MPN/100 mL	1
Total dissolved solids, mg/L	15.22
Total N, mg/L	0.006
Total P, mg/L	0.012
Total suspended solids, mg/L	6.58

¹ MDL the Minimum Detection Limit of a analyte that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. MDL is also known as the Method Detection Limit. Further information is available on the U.S. EPA website at http://water.usgs.gov/owq/OFR_99-193/detection.html

USGS Stations

Big Creek Continuous Flow

We are collaborating with USGS at Big Creek near Mt. Judea (USGS 705579; downstream of the C&H Farm operation) and at Left Fork Big Creek near Vendor (USGS 07055792), to collect base and storm water flows for N, P, and bacteria analysis. The USGS Big Creek site is instrumented with continuous flow gaging equipment and a nitrate sensor, which provides real-time flow, water temperature, nitrate-N, and precipitation data. These data are available on line at the USGS website below. Gage height, water temperature, precipitation, and continuous nitrate concentrations for the USGS downstream site for the last quarter are shown in Figures 2, 3, 4, and 5.

USGS 07055790 Big Creek near Mt. Judea, AR

¶ Values proceeded by ‘<’ were reported by the analytical laboratory as zero and the Minimum detection limit is given.

§ N.S. is No Sample.

† N.D. is No Data.

Nutrients, Sediment, and Bacteria by Site for Ephemeral Stream, House Well, Trenches, Left Fork and Field Runoff

Table 4. Water quality analyses at the ephemeral stream draining the subwatershed containing the production houses and manure holding ponds, the well adjacent to the ponds, and surface runoff from Fields 1, 5a, and 12 for the 3rd Quarter of 2015.

Date sample collected	Dissolved P	Total P	Ammonia-N	Nitrate-N	Total N	Total suspended solids	Dissolved Organic C	E. coli	Total coliform

¶ Values proceeded by '<' were reported by the analytical laboratory as zero and the minimum detection limit is given.

§ N.S. is No Sample. E. coli and total coliform were not measured on surface runoff samples collected by ISCO samplers when sample holding time exceeded the required 8-hour threshold.

† N.D. is No Data

Water pH, Alkalinity, Chloride, Electrical Conductivity, and Total Dissolved Solids for Several Big Creek Sites

At the beginning of 2015, the pH, alkalinity, chloride concentration, electrical conductivity and total dissolved solids were determined on water samples collected at the upstream and downstream sites, spring, house well, and trenches, to build a data base that will enable to eventually source track the major water source pathways at these sites. These values are given below in Table 5.

Table 5. The pH, Chloride concentration, electrical conducting, and total solids concentration of water samples collected at upstream, downstream, spring, house well and trench sites, initiated at the beginning of 2015.

Date	pH	Alkalinity	Chloride	Electrical conductivity	Total dissolved solids

Nutrient and Bacteria Concentration in Big Creek over the Monitoring Period

Upstream and Downstream Trends

The difference in dissolved P, total P, nitrate-N, total N, E. coli, and total coliform between down- and upstream monitoring sites are presented in Figures 6, 7, and 8, respectively. No consistent differences in the trends in concentrations at the downstream site on Big Creek compared with the upstream site appear evident over the current monitoring period, except for nitrate-N, which tends to be higher downstream. For nitrate-N, concentrations in Big Creek below the C&H Farm are generally greater than above it (Figure 7).

Several metrics of nutrient and bacteria concentrations were determined for measured concentrations in Big Creek since inception of the monitoring. These include the mean, standard error

June 1 to September 30, 2015

of the mean, median, minimum, maximum and standard deviation of measured constituents for 2013, 2014, and 2015. Metrics for concentrations at the upstream site are given in Table 6 and for the downstream site in Table 7.

Upstream of C&H, median E. coli increased slightly for each period (71, 97, and 93 MPN/100 mL for 2013, 2014, and 2015, respectively), while median nitrate-N (0.245, 0.114, and 0.087 mg/L for 2013, 2014, and 2015, respectively) and total N (0.33, 0.19, 0.17, for 2013, 2014, and 2015, respectively; Table 6) decreased over the same period of record. Downstream of C&H, median concentrations of dissolved and total P remained fairly constant from year to year, although the maximum total P value increased (e.g., 0.316, 0.450, and 0.544 total P mg/L; Table 7). Median nitrate-N concentrations decreased slightly from 2013 through 2015, and were 0.419, 0.256, and 0.189 mg/L, respectively, as did E. coli, which decreased from 87, 70, to 47 MPN/100mL, respectively (Table 7).

Few clear trends in measured concentrations are apparent at this time, reflecting fluctuating watershed hydrology, as well as a difference in rainfall amounts and distribution over the monitoring period.

Table 6. Mean, standard error of mean, median, minimum, maximum, and standard deviation of chemical constituents measured upstream of the C&H Farm pre-January 1, 2014 (before slurry applications started) and post-January 1, 2014 (after slurry applications started) through September 1, 2015.

§ E. coli and Total Coliform values were Log transformed.

¶ Mean, median, minimum, and maximum values for Log. transformed E. coli and Total Coliform are back transformed to natural numbers for ease of reference.

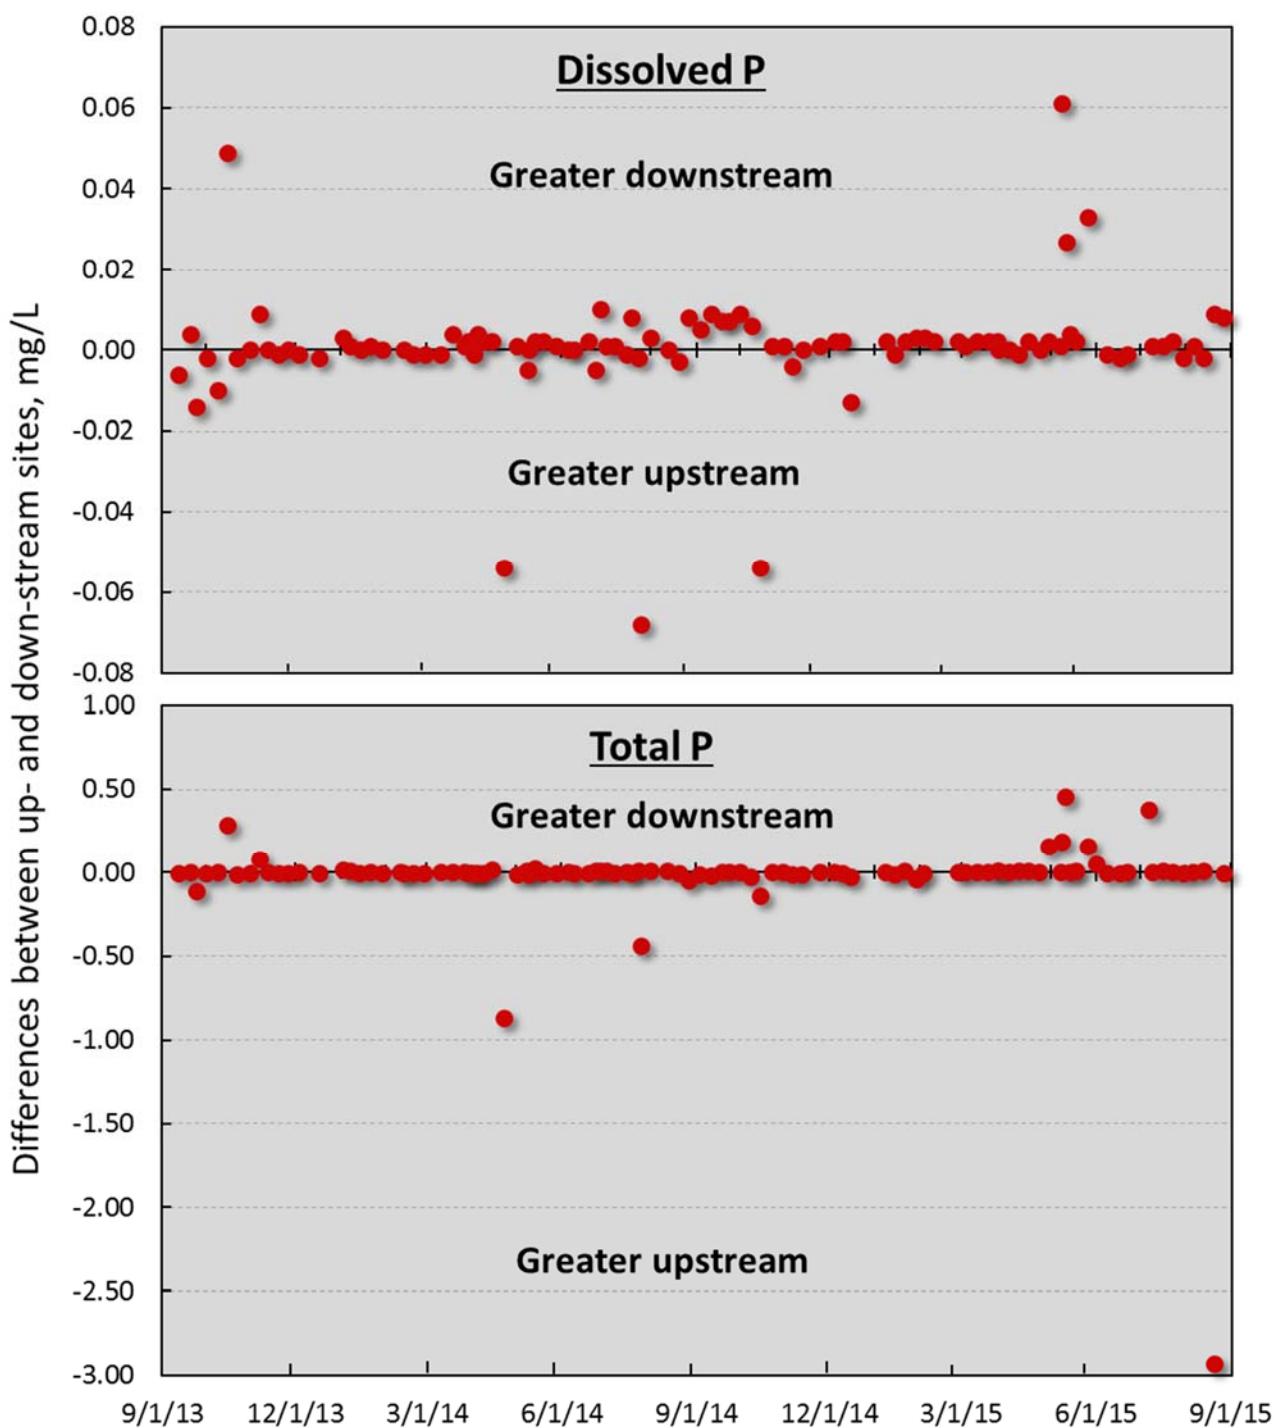

Figure 6. Differences in phosphorus concentrations between upstream and downstream sites on Big Creek.

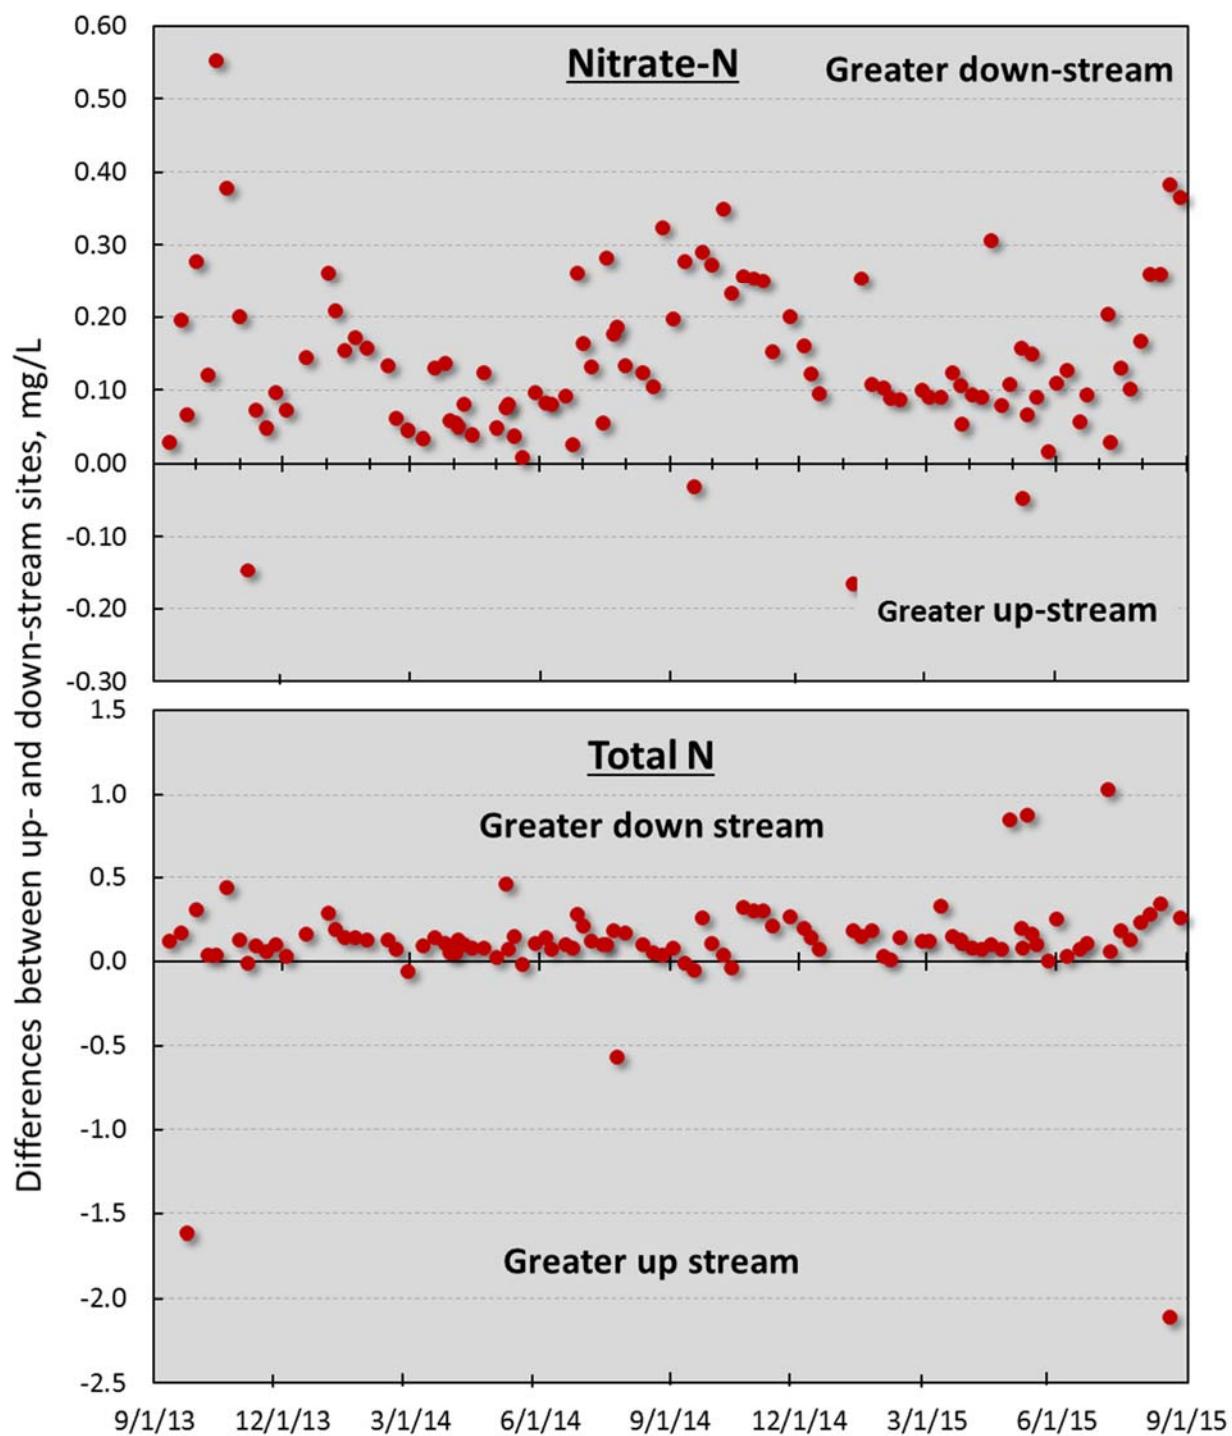

Figure 7. Differences in nitrogen concentrations between upstream and downstream sites on Big Creek.

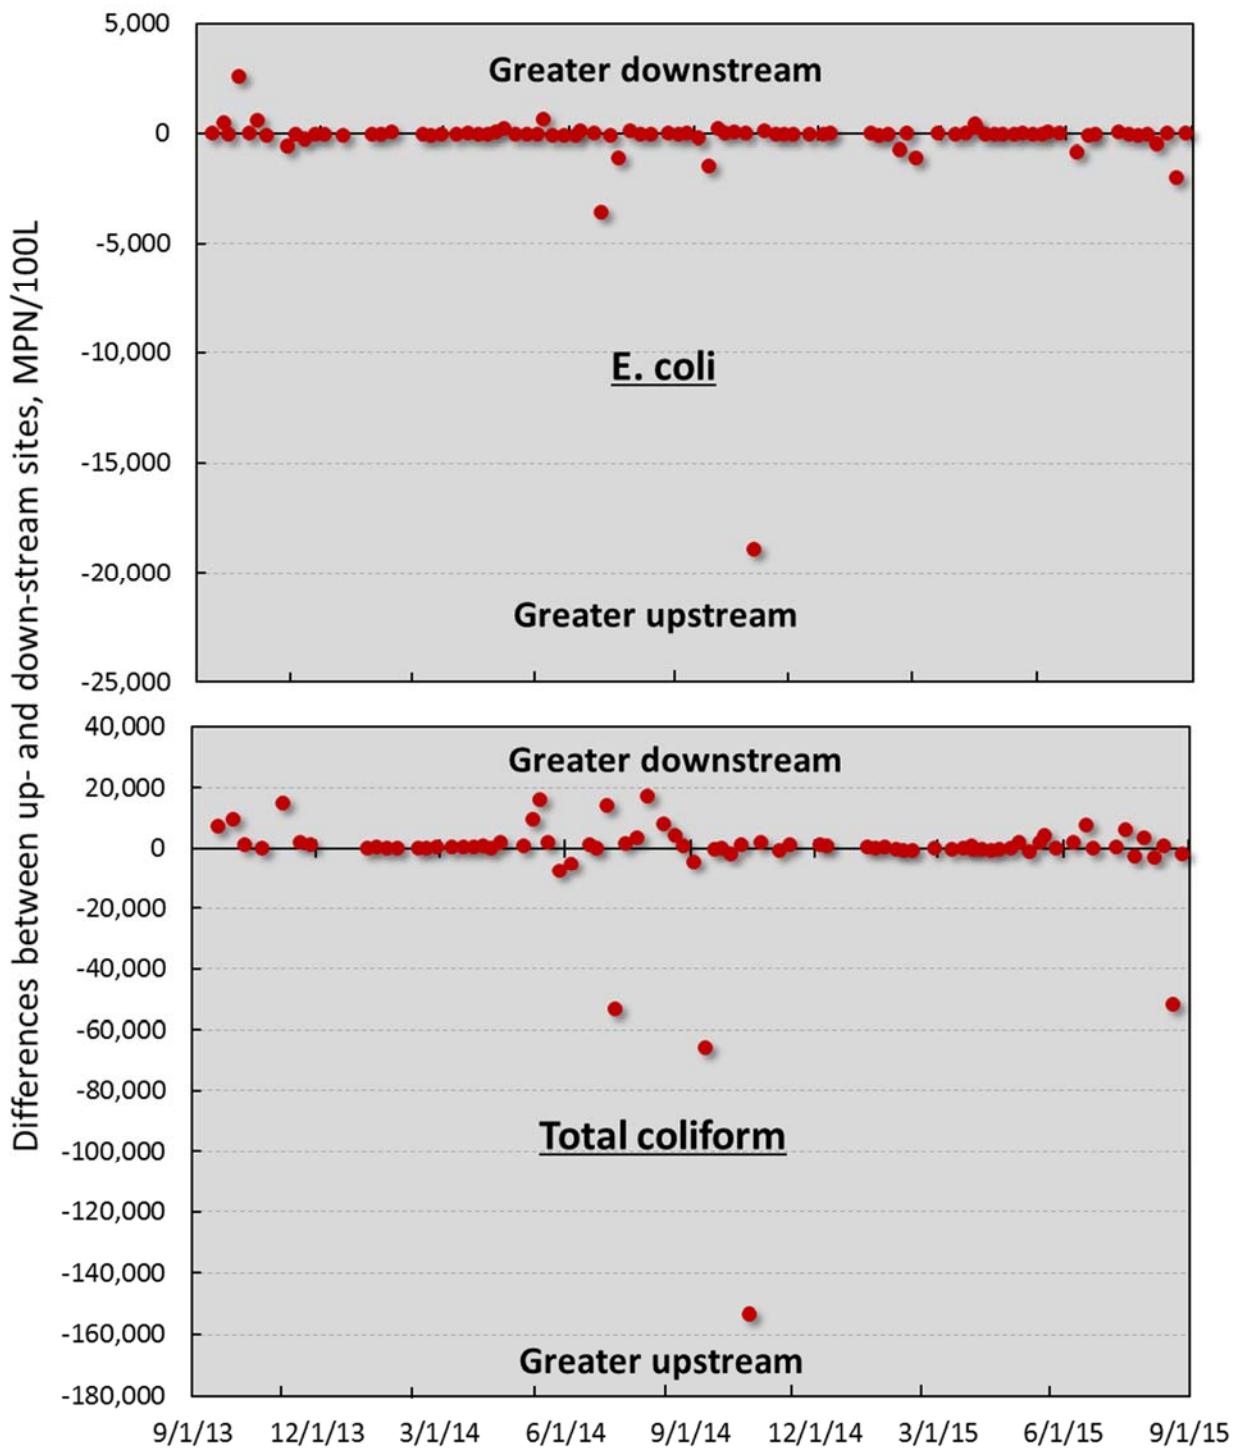

Figure 8. Differences in bacteria concentrations between up and downstream sites on Big Creek.

Temporal Trends in Nitrate-N Concentration in Big Creek

A strong seasonal fluctuation in nitrate-N concentration is apparent at the up and downstream sites on Big Creek, since we initiated monitoring on September 13, 2013 (Figure 9). Nitrate –N concentrations peak in late summer, around August to October and are at their lowest in April and May at both up and downstream sites.

These fluctuations are consistent with other watersheds of similar size and land use, and likely reflect the dominant pathways of water contributing to flow in Big Creek. In April and June (late spring), flows in Big Creek tend to be dominated by surface flows as a result of spring rains. However, in August through October, flows in Big Creek tend to be dominated more by base or groundwater flows, which generally have a higher concentration of nitrate-N than in surface runoff.

Further, the fact that the late summer nitrate-N peak was more clearly defined in 2014 than 2015, reflects the drier summer of 2014 than 2015. In May, June, July, and August 2014 there was 536 mm rainfall, while during the same months in 2015 there was 650 mm rainfall, as a consequence, the baseflow signature would have been stronger in the drier 2014 than the wetter 2015 (Figure 9).

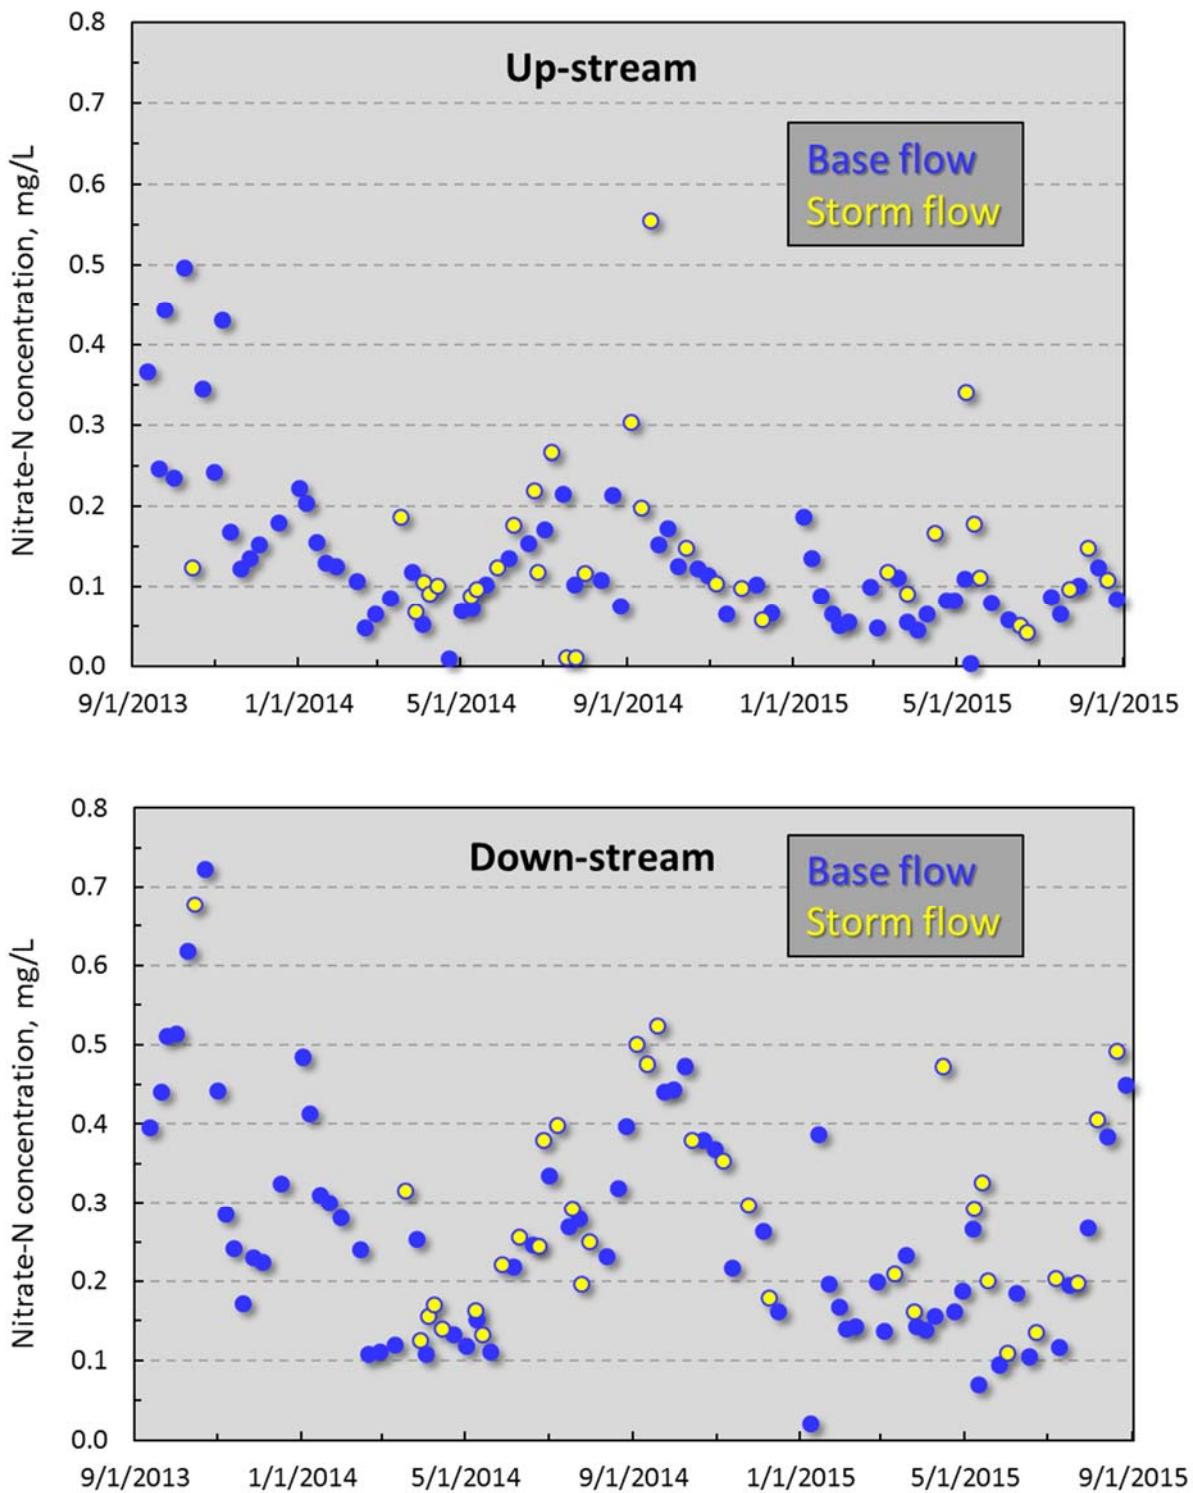

Figure 9. Temporal variation in nitrate-N concentrations upstream and downstream of the C&H Farm, Newton County, over a two-year period of monitoring (Sept. 2013 to Sept. 2015).
